12.13.3.4: Question: In answering a question on a multiple choice test, a student either knows the answer or guesses. Let $3/4$ be the probability that he knows the answer and $1/4$ be the probability that he guesses. Assuming that a student who guesses at the answer will be correct with probability $1/4$. What is the probability that the student knows the answer given that he answered it correctly?

Answer: 0.936

Solution: Let K be the random variable that represents whether the student knows the answer or not. If $K=1$, the student knows the answer, and if $K=0$, the student guesses. Let C be the random variable that represents whether the student answered the question correctly or not. If $C=1$, the student answered correctly, and if $C=0$, the student answered incorrectly. We want to find the conditional probability $\Pr(K = 1|C = 1)$, which is the probability that the student knows the answer given that he answered correctly.

We are given that:

$$\Pr(K = 1) = \frac{3}{4} \quad (1)$$

$$\Pr(K = 0) = \frac{1}{4} \quad (2)$$

$$\Pr(C = 1|K = 1) = 1 \quad (3)$$

$$\Pr(C = 1|K = 0) = \frac{1}{4} \quad (4)$$

$\Pr(K=1)$ = probability that the student knows the answer.

$\Pr(K=0)$ = probability of that student guesses.

$\Pr(C = 1|K = 1)$ = the probability that the student answers correctly given that he knows the answer.

$\Pr(C = 1|K = 0)$ = the probability that the student answers correctly given that he guesses.
We can use the moment generating function (MGF) of K to find $\Pr(K = 1|C = 1)$.

The MGF of K is given by:

$$M_K(t) = E[e^{tK}]$$

Using the given probabilities, we can compute the expected value of $[e^{tK}]$

$$\begin{aligned} E[e^{tK}] &= e^t \cdot \Pr(K = 1) + \Pr(K = 0) \\ &= \frac{3}{4} \cdot e^t + \frac{1}{4} \end{aligned}$$

Now, we can use Bayes' theorem and the MGF of K to find $\Pr(K = 1|C = 1)$:

$$\Pr(K = 1|C = 1) = \Pr(C = 1|K = 1) \cdot \Pr\left(\frac{K = 1}{C = 1}\right)$$

$$\Pr = M_K(t = 1) \cdot \left(\Pr\left(\frac{K = 1}{t = 1}\right)\right) \cdot \Pr(K = 1) + M_K(t = 0) \cdot \Pr(K = 0)$$

$$\Pr = \left(\frac{3}{4} \cdot e^1 + \frac{1}{4} \cdot e^0\right) \cdot \frac{\frac{3}{4}}{\left(\frac{3}{4} \cdot e^1 + \frac{1}{4} \cdot e^0\right)} \cdot \frac{3}{4} + \left(\frac{1}{4} \cdot e^1 + \frac{3}{4} \cdot e^0\right) \cdot \frac{1}{4}$$

$$\Pr = \frac{3 \cdot e}{(3 \cdot e + 1)}$$

$$\Pr = 0.936$$

Therefore, the probability that the student knows the answer given that he answered it correctly is approximately 0.936.
